

How To Create a cPanel Account in WHM

In this Tutorial we are going to learn How To Create a cPanel Account in WHM?

What is Cpanel?

cPanel is a Linux-based [web hosting control panel](#) that provides a graphical interface and automation tools designed to simplify the process of hosting a web site. cPanel also has command line and API-based access that allows third party software vendors, [web hosting](#) organizations, and developers to automate standard system administration processes. Application-based support includes [Apache](#), [PHP](#), [MySQL](#), [PostgreSQL](#), [Perl](#), and [BIND](#) (DNS). Email based support includes [POP3](#), [IMAP](#), and [SMTP](#) services. cPanel is accessed via https on [port](#) 2083.

What is WHM?

WebHost Manager is a [web-based](#) tool used by [server administrators](#) and [resellers](#) to manage [hosting](#) accounts on a [web server](#). WHM listens on [ports](#) 2086 and 2087.

Why we are create Cpanel? Why we are use WHM? What is the purpose?:

From WHM, the server administrator can perform maintenance operations such as upgrade and recompile Apache & PHP, install Perl Modules, and upgrade [RPMs](#) installed on the system.

For Creating Cpanel account We are using WHM.

Prerequisites:

Process:

STEP 1:

For Login into **WHM** account go to Lastpass vault

After that you can see below screen

A.] click on [...] icon to open lastpass vault.

B.]Search WHM in search vault field

C.]After that you can see list of related result which you have search in above steps

In that you can see “WHM” click on that link

D) After that you can see below screen (depending on your browser).

For mozilla firefox

A)Click on ‘Advance’ button

B)click on ‘Add Exception’ button

C)click on ‘Confirm Security Exception’

For Google Chrome

A)Click on ‘Advance’ button

B)click on ‘Proceed to(unsafe)’ text

After following all above steps then you can see “WHM” login page or else you can logged into directly and see “WHM” DashBoard.

STEP 2:

After you have logged into WHM, there are two ways to navigate to where you can create a cPanel account. First, you could click on the Account Functions, and on that page click Create a New Account. Alternatively, you could search for “Create a New Account” in the Find bar in the upper left hand corner of WHM.

A].select ““Create a New Account” you can see below screen on your computer

1.)First, WHM needs to know what the domain name will be for the primary website on this cPanel account

2.)WHM will use that domain to create a username for the cPanel account . This username is usually the first eight letters of the domain. Also, this username cannot be longer than eight letters.

3.)This cPanel account needs a password .

4.)It will also need this password retyped to make sure that you did not type it incorrectly when creating

the password. If you like, you can use the built-in Password Generator to create a [secure password](#).

5.) Finally, the cPanel account requires an e-mail address . WHM automatically sends important information about the account to this e-mail address as events warrant.

STEP 3:

After that click on “**CREATE**” Button.No need to change other data.

It will take some time for the server to create the account, so sit back for a bit as it configures everything. This should take no longer than a few minutes. When finished, WHM will tell you that it has been created successfully.

If WHM warns that the account has not been created, this usually happens because a setting was missed that needed to be set. It should be a simple matter to hit the back button and add that setting. If you are unable to create the account, and you believe that you have set everything properly, do not hesitate to contact **Liquid Web Support** .

Testing or What can go wrong?

Check Whether you have entered correct Domain name.

Is wrong check again for above steps.

Important Note:After created cpanel you must be save that login details in lastpass.
